What's New in the Adobe Photoshop 2022 ()?

Q: Question about the time period where $\frac{d}{dt}x(t) = x(t)$ Suppose that $x:[0,1] \to \mathbb R$ satisfies the differential equation $\frac{d}{dt}x(t) = x(t)$ for all t. What can we say about the time $t_0 \in [0,1]$ at which the function x is a constant function? In other words, for which t_0 is it the case that $x(t_0) = c$ for all t_0? I don't know much about differential equations, so I'm not sure if it's trivial or not but I'm hoping for an answer to the

question. If anyone has a hint or idea, it would be great. A: Edit. I think that the question is simpler than the original one. Let us assume that $$x(t) = \int_0^t\tau(s)\,ds,$$ where $\tau(s)$ is a nonnegative function such that $\int_0^1\tau(s)\,ds=1$. Then, the equation above is equivalent to the following one: $$\frac{d}{ds}x(s) = \tau(s).\tag{1}$$ Let $s_0\in[0,1]$ be a fixed time and denote by x_1 the constant value of x on $[0,s_0]$. That is, $$x(s) = x_1,\quad\forall

$s\in[0,s_0].\tag{2}$$ Since the function τ is continuous and the constant function x_1 is fixed, the initial condition (2) implies that the following statement holds: $$\lim_{s\to0^+}\tau(s) = \tau(0^+) = \lim_{s\to0^-}\tau(s).\tag{3}$$ Now, observe that the function $x\_1\tau$ is an antiderivative of the function τ on $[0,s\_0]$. Therefore, integrating both sides of $(1$
