When evaluating the anterior cruciate ligament (ACL), three main imaging planes are used: an anteroposterior (AP) scan and a 30° and a 90° Lauenstein-Hausler view. The goal of this study was to describe what imaging planes are necessary in evaluating ACL injuries and how these results compare with other available studies. A retrospective review was performed on 60 knees with isolated ACL tears on magnetic resonance imaging (MRI) between July 2011 and April 2014. All patients were imaged with both AP and 30° and 90° Lauenstein-Hausler views. Additionally, patients were examined with the aforementioned views supplemented with a complete set of axial and coronal oblique MRI. Imaging planes were evaluated for the overall degree of ACL tear, classification, and presence of associated knee injuries. Fisher Occ13bf012

Minibar QQ132707352 No issues with drivers, it is a first for me, but the driver installs perfectly, thank you for helping! I got it to work on my MacBook Pro 13' as well. A: As you can see in your screenshot, your printer has no drivers. This is because you're running a printer on a computer that is not the same model as the one you created your setup on. From the menu that popped up when you first turned on your printer, look for Troubleshoot and/or Install Drivers. If that doesn't work, do as this article tells you to do: You should be able to find that in there. As for the drivers being pulled down, the next time you turn on your computer, either your printer will be detected (if it is indeed on), or it will be unplugged and plugged in again. Experimental design, data collection and analysis in fisheries science. This paper describes the development and application of a structured approach to experimental design, data collection and analysis in a broad area of fisheries science. This approach is based on a formalized decision tree and a series of 'if-then' decision points. Examples of areas where this approach has been used are outlined, including (1) stratification of control versus field experiments, (2) designs to quantify multiple ecosystem responses, (3) experimental fisheries design, (4) experimental approaches to the evaluation of on-set management, (5) experimental designs for recovery studies, (6) experimental designs to test habitat effects, and (7) the design of experiments to examine behavioural responses to changing fishing gear. Although the principles of the approach can be applied generally, the examples illustrate the utility of the approach in particular areas of fisheries science.Q: C++ constructor and destructor call sequence If I call the destructor of an object before the constructor, will that cause some unexpected results for the constructor? In the example I use, the array size is an integer. #include using namespace std; class A { public: A(int sz) {
