Each IP network is a set of IP addresses within the same local area. . . . An IP address allows information to be transmitted from one host to another. . . . A typical computer operating system has different ways to view and use an IP address. This chapter addresses a popular method—the Network Address Translation (NAT) protocol. . . . A large ISP can use NAT to provide a number of IP addresses to different subnetworks. The ISP uses the NAT protocol to share one large pool of IP addresses between multiple subnetworks. This simplifies managing many computers. However, the use of NAT creates some problems. The host computers on the subnet must use NAT. The router must modify Internet traffic to move it into and out of the subnetwork. This chapter explains when NAT makes sense and when it presents problems.
